

SEVAN GOENEZEN

Academic Trajectory — subway-map view

Career arc. Sevan Goenezen trained at **Rensselaer Polytechnic Institute** (arriving 2007) under **Assad Oberai** and **Paul Barbone**, where his thesis established the nonlinear elasticity inverse-problem program on which his entire career builds. A brief 2012–2013 postdoc at **Oregon Health & Science University** with **Sandra Rugonyi** produced a short but productive thread on embryonic heart biomechanics — the same inverse-problem machinery applied to congenital-defect research. He joined **Texas A&M University** as faculty in 2014, and it is there that the bulk of the MBT lineage developed. His doctoral student **Yue Mei** became his dominant collaborator (14 joint papers) and eventually the intellectual heir of the group. The 2017 *Sensors* paper “Mechanics Based Tomography: a preliminary feasibility study” is the canonical naming of the MBT framework; the 2021 *J. Mech. Phys. Solids* MBT-validation paper is its experimental coming-of-age. Parallel collaborations with **M.R. Hematiyan** and **Hajhashemkhani** connect Goenezen into a Shiraz-centred mechanics network. A 2021 move to **Texas State University** and recent branches into biodegradable-magnesium-stent design and DIC-based surface-deformation measurement mark his current phase.

Profile source: OpenAlex. 39 works, 1047 citations, h-index ≈ 18 . OpenAlex affiliations show RPI 2007–2018 (overlap reflects continued collaborations), OHSU 2012–2013, Texas A&M 2014–2023, Texas State 2021–. “Walker (United States)” affiliation in 2023 is likely a corporate co-authorship, not a home institution. Disambiguation: the top candidate had 39 works matching the elastography + MBT signature and all expected co-authors; no confusion with other “Goenezen” entries.
